                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Elenich L.A., Nandi D., Kent E.A., McCluskey T.S., Cruz M., Iyer M.N., Woodward E.C., Conn C.W., Ochoa A.L., Ginsburg D.B., Monaco J.J.;
"The complete primary structure of mouse 20S proteasomes.";
Immunogenetics 49:835-842(1999)
-!- FUNCTION: THE PROTEASOME IS A MULTICATALYIC PROTEINASE COMPLEX WHICH IS CHARACTERIZED BY ITS ABILITY TO CLEAVE PEPTIDES WITH ARG, PHE, TYR, LEU, AND GLU ADJACENT TO THE LEAVING GROUP AT NEUTRAL OR SLIGHTLY BASIC PH. THE PROTEASOME HAS AN ATP-DEPENDENT PROTEOLYTIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: The proteasome is composed of at least 15 non identical subunits which form a highly ordered ring-shaped structure. This subunit can be displaced by the equivalent immune-specific subunit
                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STRAIN=129/SvJ, and C57BL/6;

This invention describes a novel antibody specifically recognizing phosphatidylinositol-3,4,5-triphosphate (PIP3). The antibody of the invention is used in immunogenic compositions in which a dead Salmonella genus microbe is used as an adjuvant and mixed with PIP3. The antibody can be used in an immunoassay containing a step in which the above antibody or its variable region is reacted with PIP3 present in a sample and the bond based on their immunological reaction. The method can determine PIP3 easily in a high sensitivity. This sequence represents the murine PIP3 recognizing monoclonal antibody variable region heavy chain complementarity determining region, CDR1 described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel antibody specifically recognizing phosphatidylinositol-3,4,5-triphosphate (PIP3). The antibody of the invention is used in immunogenic compositions in which a dead Salmonella genus microbe is used as an adjuvant and mixed with PIP3. The antibody can be used in an immunoassay containing a step in which the above antibody or its variable region is reacted with PIP3 present in a sample and the bond based on their immunological reaction. The method can determine PIP3 easily in a high sensitivity. This sequence represents the murine PIP3 recognizing monoclonal antibody variable region light chain described in the method of the invention.
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Murine PIP3 recognizing Mab variable region light chain protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PIP3; phosphatidylinositol-3,4,5-triphosphate; variable region; immunogen; antibody; light chain.

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate immunodeficiency virus (e.g. human immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and inflammation, atopic dermatitis and psoriasis), inflammatory diseases (e.g. skin inflammatory diseases (chronic arthritis), inflammatory couch as inflammatory bowel diseases and inflammatory bowel diseases and inflammatory bowel diseases and inflammatory bowel diseases and arthritism inflammatory in the manual diseases and inflammatory howel diseases and inflammatory bowel diseases and inflammatory in the manual diseases and inflammatory bowel diseases and suffared ward transplant rejections. The present sequence is murine Mc-1 antibody light chain variable domain (VL) complementarity determining region 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of an antibody and/or chemokine construct that binds to a chemokine receptor, for eliminating cells latently infected with primate immunodeficiency virus, or treating, preventing and alleviating immune

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate immunodeficiency virus (e.g. human immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and rheumacoin architis), allergic diseases, skin diseases (e.g. skin inflammation, atopic dermatitis and psoriasis), inflammatory diseases such as inflammatory joint diseases (chronic arthritis), inflammatory renal diseases and inflammatory bowel diseases and graft versus host and transplant rejections. The present sequence is murine MC-1 antibody light chain variable domain (WJ) II). This antibody is specific for human chemokine receptor 5 (CCRS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of an antibody and/or chemokine construct that binds to a chemokine receptor, for eliminating cells latently infected with primate immunodeficiency virus, or treating, preventing and alleviating immune

The MAD can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anti-DNA antibody which specifically binds DNA hairpin - useful to develop prods. for diagnosis and treatment of disorders, e.g. glomerulonephritis or systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disorder.

Calf thymus DNA was used to immunise a MRL-ipr mouse, spleen cells from which were then fused with Sp2/0 myeloma cells to give hybridomas producing the anti-DNA MAD. 15d8 was found to react strongly with single stranded DNA and poly(dT), and weakly with poly(dG).
                                                                                                                                                                                                                       Light chain; variable region; anti-DNA; monoclonal; antibody; MAb 1568; hairpin; diagnosis; inflammatory glomerulonephritis; systemic lupus erythematosus; screening; treatment; prevention; SLE; disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

The MAb can be used diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above disorder.

Calf thymus DNA was used to immunise a MRL-lpr mouse, spleen cells from which were then fused with Sp2/0 myeloma cells to give hybridomas producing the anti-DNA MAD. 9f11 was found to react poly (dG).

The MAD can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematous. It can also be used to generate reagents to screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           - useful to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Anti-DNA antibody which specifically binds DNA hairpin - useful to develop prods. for diagnosis and treatment of disorders, e.g. glomerulonephritis or systemic lupus erythematosus
                                                  Calf thymus DNA was used to immunise a MRL-1pr mouse, spleen cells from which were then fused with Sp2/0 myeloma cells to give hybridomas producing the anti-DNA MAD. 15b10 was found to react strongly with single stranded DNA and poly(dT), and weakly with poly(dG).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Light chain; variable region; anti-DNA; monoclonal; antibody; MAb 5f3; hairpin; diagnosis; inflammatory glomerulonephritis; systemic lupus erythematosus; screening; treatment; prevention;

                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
The present sequence is the light chain variable region of the anti-DNA monoclonal antibody (MAb) 5f3, which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically binds a DNA hairpin. The MAb can be used diagnose
                                                                                                                                                                                                      disorder. Calf thymus DNA was used to immunise a MRL-lpr mouse, spleen cells from which were then fused with \mathrm{Sp2/0} myeloma cells to give hybridomas producing the anti-DNA MAb.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             æ
                                                                                                disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "human framework residue 43 is substd. by consensus amino acid of the equivalent

                                                                                                                                                                      The variable region (AAW05822) of the humanised 1D10 antibody light chain (AAW05828) consists of human R3.5H5G kappa.light chain variable region framework (substd. at 5 positions with mouse or consensus human amino acids) and complementarity determining regions from the murine 1D10 antibody specific for a 28/32 kDa heterodimeric antigen present on the surface of malignant B-cells. It can be coexpressed with humanised 1D10 heavy chain (see also AAW05829) in e.g. mouse myeloma NSO cells. Humanised antibody fragments can be incorporated into novel bispecific antibodies reactive with both effector cell antigens (see also AAW05820) and malignant B-cells.
                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Light chain; variable region; anti-DNA; monoclonal; antibody; 9f11 group; hairpin; diagnosis; inflammatory glomerulonephritis; systemic lupus erythematosus; screening; treatment; prevention;
                                                                              New bispecific antibody reactive with both T or NK cells and malignant B cells - also their humanised forms and hybridomas producing them, useful for treating or preventing leukaemia,

                                                                                                                                                                                                                                                                 The present sequence is the light chain variable region of the group 9f11 putative consensus anti-DNA monoclonal antibody (MAb), which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically binds a DNA hairpin. The MAb can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above disorder.

The sequence was derived by aligning homologous anti-DNA MAb, whose sequences have been published, as well as several MAb of other specificities obtained from a database search.

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate immunodeficiency virus (e.g. human immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and rheumatoin, atopic dermatitis and psoriasis, inflammatory diseases such as inflammatory joint diseases (chronic arthritis), inflammatory renal diseases and inflammatory bowel diseases and graft versus host cand transplant rejections. The present sequence is murine MC-1 antibody light chain variable domain (WJ)[1]. This antibody is specific for human chemokine receptor 5 (CRS).
                                         Use of an antibody and/or chemokine construct that binds to a chemokine receptor, for eliminating cells latently infected with primate immunodeficiency virus, or treating, preventing and alleviating immune

conditions, particularly a single 2-5 minute photoactivation results in almost 100% attachment (contrast conditions usually required to attach

molecules to antibodies.

This is the amino acid sequence of 8019 VK antibody. The invention relates to the site-specific photo-attachment of a nucleic photoaffinity compound to an antibody which comprises reacting them under conditions that promote attachment of the photoaffinity compound to at least 1 nucleotide binding site in the antibody. Also claimed are: photoaffinity compound-antibody conjugates produced this way, and immuno-conjugates comprising cytotoxic or therapeutic agent site-specifically attached to the photoaffinity compound in the conjugate. When the conjugate is labelled it is used for detection or quantitation of an antigen (Ag) by any standard immunoassay format, while immuno-conjugates are used therapeutically, e.g. in cases tumours, infections or genetic diseases, or as imaging agents. The photoaffinity compounds are attached under mild, physiological

                                                                                                                                                                                                                                                                                                                                                                                                      This is the light (kappa)-chain variable (V) region of a mouse monoclonal antibody (MAb), 2G12, and is specific for an HIV-1 viral antigen. It is used in the construction of a chimeric MAb comprising heavy and light chains having murine V regions and human C regions. The chimeric MAbs are more effective than murine MAb 2G12 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MAbs can be used as immunoconjugates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The humanised 1D10 antibody light chain (AAW05828) includes a variable region (see also AAW05822) consisting of human R3 5HG light chain variable region (tramework and complementarity determining regions from the murine 1D10 antibody specific for a 28/32 kDa antigen found on the surface of malignant B-cells. It can be coexpressed with humanised 1D10 heavy chain (see also AAW05829) in mammalian host cells. Bispecific antibodies can be constructed that include a first binding fragment comprising humanised M291 heavy and light chain variable regions (see also AAW05826, AAW05830), and a second binding fragment comprising humanised 1D10 heavy and light chain variable regions. Such antibodies are reactive with both T or NK cells and malignant B cells, and have therapeutic and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New bispecific antibody reactive with both T or NK cells and malignant B cells - also their humanised forms and hybridomas producing them, useful for treating or preventing leukaemia, lymphoma and myeloma

P4-15 single chain Fv.

```
This sequence is encoded by the Fabbabb Liggment or the planshing pULI40 and represents the heavy Chain and light chain variable regions (WH and VL) of the monoclonal antibody (MAD) PR1. The CDNA encoding this sequence was derived by PCR amplification of reverse transcribed PR1-hybridoma RNA using the primer sequences given in AAG64477-81. The VH and VL complementarity determining regions (CDRs) are used in the construction of the MAD of the invention which competes with PR1 for binding to a prostate call of the invention which competes with PR1 for binding to a prostate call of a patient suffering from prostate cancer. It can also be used for the diagnosing the presence of prostate cancer in an individual and for the diagnosing the presence of prostate cancer in a conviction abnormal growth of prostate cells, eg. benign prostate cancer in the hyperplasia. The MAD reacts strongly with prostate cancer cells but only weakly with a few other normal human tissues. The effect of the relation of the cancer cells of the relation of the cancer cells of the cancer cells of the cancer of the cancer cells of the cancer of the cancer of the control of the cancer of the ca

```
The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated polymercecide are used for the polypeptide and its associated polymercecide are used for the preparation of a pharmaceutical composition for the treatment of cancer, infections and/or autoimmune composition. The cancer may be a tumour of the head and neck, stomach, oesophagus, colon, liver, intrahapatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, larynx, breast, ovary, uterus, caused by viruses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple clerosis, Grave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent diabetes mellitus, rheumatoid arthitis, pemphigus vulgaris and autoimmune hepatitis. Sequences AAU72820-AAU72875 represent the NKG2D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence is the recombinant mouse anti-rotavirus antibody. It comprises of mouse heavy chain (VH) and light chain (VL) variable regions joined by a linker. The recombinant antibody encoding DNA is inserted into pCANTAB 5E expression vector (clone 11). The vector is used to transform probiotic bacteria like, Lactobacilli for expression and secretion of recombinant anti-rotavirus antibodies. The antibodies have antibacterial and antiviral activity. Antibody-expressing probiotic bacteria can be administered for treatment of gastrointestinal (GI) tract infections and to immunise neonates, humans or immunosuppressed/immunodeficient adults acutely exposed to a bolus of GI pathogen.
                                                                                                                                         Recombinant anti-rotavirus antibody; mouse; heavy chain variable region; Wl; light chain variable region; VL; pCANTAB 5E vector; treatment; probiotic bacteria; antibacterial; antiviral; gastrointestinal tract; immunise; neonate; immunosuppressed; immunodeficient; di pathogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition for supplementing or replacing an immune response against gastrointestinal pathogens in e.g. newborn infants, comprises probiotic microorganisms expressing antibodies specific for the gastrointestinal

It comprises of mouse heavy chain (WH) and light chain (VL) variable regions joined by a linker. The recombinant antibody encoding DNA is inserted into pCANTAB 5E expression vector (clone 22). The vector is used to transform probiotic bacteria like, Lactobacilli for expression and secretion of recombinant anti-rotavirus antibodies. The antibodies have antibacterial and antiviral activity. Antibody-expressing probiotic bacteria can be administered for treatment of gastrointestinal (GI) tract infections and to immunise meonates, humans or immunosuppressed/immunodeficient adults acutely exposed to a bolus of GI pathogen.
                                                                                                                                      Recombinant anti-rotavirus antibody; mouse; heavy chain variable region; Wl; light chain variable region; VL; pCANTAB SE vector; treatment; probiotic bacteria antibacterial; antiviral; gastrointestinal tract; immunise; neonate; immunosuppressed; immunodeficient; GI pathogen.

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate immunodeficiency virus (e.g. human immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and rheumatoin, atopic dermatitis and psoriasis), inflammatory diseases (c.g. multiple sclerosis, type I diabetes such as inflammatory joint diseases (chronic arthritis), inflammatory as inflammatory bowel diseases and inflammatory bowel diseases and graft versus host and transplant rejections. The present sequence is CRRxCD3 bispecific and transplant rejections. The present sequence is CRRxCD3 bispecific single chain antibody construct. This antibody construct comprises of murine MC-1 antibody specific for human chemokine receptor 5 (CCR5) and M and WL domains of an antibody specific for a CD3 antigen joined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of an antibody and/or chemokine construct that binds to a chemokine receptor, for eliminating cells latently infected with primate immunodeficiency virus, or treating, preventing and alleviating immune

```
The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular compain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions of a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmune compositions. The cancer may be a tumour of the head and neck, stonach, coephagus, colon, liver intraheptic bile ducts, pancreas, lung, conditions. The cancer may be a tumour of the head and neck, stonach, coephagus, colon, liver intraheptic bile ducts, pancreas, lung, larymx, breast, ovarry, uterus, cervix, prostate, kidney, testis, thyroid, larymx, breast, ovarry, uterus, cervix, prostate, kidney, testis, thyroid, complete or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protozoa or helminchs. The autoimmune diseases include multiple sclerosis, Grave's disease, ankylosing spondylitis, acute anterior cueitis, soluciamune hepatitis. Sequences AAU72820-AAU72875 represent the NKG2D receptor and the polypeptides of the invention.
